Diagnosing embedded V2 in Old French and Old English

Christine Meklenborg Salvesen & George Walkden
University of Oslo               University of Manchester
Preliminaries

- Old English (OE, 450 – ca. 1100) and Old French (OF, 842 – ca. 1350) both exhibit verb second (V2) word order in main declarative clauses, even though OE also has verb final clauses ("a mixed grammar", Lightfoot 1999).
- Both languages have embedded V2.
V-movement in V2 languages

- Landing site of the finite verb in modern V2 languages: $C^o$ (left periphery) (den Besten 1977, Evers 1981 and Schwartz & Vikner 1996) or $I^o$ (IP field) (Travis 1984 and Zwart 1993)?

- It has been widely debated whether OE and OF are “true” V2 languages, and whether verb-movement is to CP or IP. Two possible landing sites for the finite verb; three different classes of analysis:
Object of this presentation

- Analyse embedded V2 in OE and OF, and compare the results.
  - Why OE and OF? Because:
    - a) similar analytical and methodological issues arise for both
    - b) OF is widely known to exhibit “Germanic” properties (see Mathieu 2009 for overview).
- Evaluate the I-V2 and the C-V2 hypotheses by using embedded V2 as a tool in order to determine which head the finite verb moves to in main declarative clauses.
I-V2

- The finite verb moves to a head in the IP-field ($T^0$), and an XP moves into its specifier position.
- $T^0$ carries a V feature and an EPP feature.
- SpecTP is an A' position.
C-V2

- The finite verb moves to a head in the left periphery (e.g. C° or Fin°), and an XP moves to its specifier position.
- The head in question carries a V feature and an EPP feature.
- The specifier position is an A’ position.
- SpecTP is a A position reserved for the subject.
Predictions

- It’s accepted that complementizers are first merged in a head in the left periphery. So:
  - I-V2: predicts that embedded V2 will be found in the complement clauses of all kinds of verbs (the complementizer cannot block verb movement).
    - This may be the case for e.g. Icelandic (though complications arise with respect to Stylistic Fronting).
  - C-V2: predicts that embedded V2 will only be possible in the complement clauses of certain verbs (the complementizer may block verb movement).
    - This is the case for modern Mainland Scandinavian (Vikner 1995, Julien 2009).
Method

- Electronic corpora
Key data

- **OE:**
  - Exhaustive sample of 400 non-subject-initial XP-V-... verbal complement clauses.
    - This includes a large number of examples that we may not want to consider evidence for true V2, i.e. V-in-C.
  - Sample of 879 of all other verbal complement clauses (every 13\textsuperscript{th} example).
- **OF:** 896 clauses; 190 of these having V2 properties (true V2 or pro in the subordinate clause)
What is embedded V2?

- Embedded V2 in OE and OF may have two manifestations
  - Embedded clause with (non-subject-initial) V2 word order
  - Embedded pro (not in OE)
V2 and Stylistic Fronting in OF

- Is embedded V2 actually embedded Stylistic Fronting (SF) (Mathieu 2006, 2012)?
- SF typically ...
  - ... involves a subject gap
  - ... the fronting of a head
  - ... is clause-bound
  - ...obeys the Accessibility Hierarchy (see Maling 1982 and subsequent literature)
- Note that SF can also involve phrases (Holmberg 2000, Mathieu 2006)
- The subject gap condition may have two interpretations: Either there must be a pro subject (strong version) or SpecTP must be empty (weak version).
Postverbal pronominal subjects

- In OF the pronominal postverbal subject occupies SpecTP; the nominal postverbal subject sits lower (Vance 1997; Bech & Salvesen forthcoming).
- Strong version: SF is only possible with a pro.
- Weak version: SF is possible with pro and postverbal DP subjects.
- In either case SF is incompatible with postverbal pronominal subjects.

V2 in OF is not SF

- We conclude that OF has embedded V2.
- We make the assumption that in either case, SF and V2 involves verbal movement to the same head (contra Mathieu 2006).
There is no SF in OE

- Okhado (2010) and Fischer (2010: 102–106) claim that OE also exhibits SF. But:
  - Okhado's (2010) results are not unequivocal
  - Haeberli (2011) demonstrates that there is no clear evidence for SF in OE: the proportion of fronting in subjectless clauses is not consistently significantly higher than in clauses with subjects (either full or pronominal)
- We will therefore assume that SF was not operative in OE.
Hooper & Thompson (1973) distinguish between five different classes of verbs (A–E) according to the discourse status of their complement clauses.

- **A**: strong assertion, typically verbs of saying. (Ex.: say, report, exclaim, assert, claim, vow, be true, be certain, be sure, be obvious)
- **B**: weak assertion, typically verbs denoting mental processes. (Ex.: suppose, believe, think expect, guess, imagine, it seems, it happens, it appears)
- **C**: neither presupposed nor assertive. (Ex.: be (un)likely, be (im)possible, be (im)probable, doubt, deny)
- **D**: semi-factive, presupposed; typically expressing an emotion or subjective attitude. (Ex.: resent, regret, be sorry, be surprised, bother, be odd, be strange, be interesting)
- **E**: factive/presupposed (Ex.: realize, learn, find out, discover, know, see, recognize)
Predictions

- Complements of classes A, B and E should be able to exhibit main clause phenomena such as embedded V2.
- Complements of classes C and D should not.
Difficulties using H&T’s classification

- H&T describe verbs that take finite complements in Modern English.
- More verbs in OE and OF take finite clausal complements than in their modern counterparts. Especially verbs of ‘volition’ are difficult to fit into the system.
  
  gyf we willað þæt us gehyre se heofonlica God  
  if we want that us hear the heavenly God  
  ‘if we want heavenly God to hear us’ (OE; coaelhom,+AHom_5:178.795)  
  
  Dame, fait il, que volez vos que je vos face  
  lady made he what want you that I you do  
  ‘Milady, he said, what do you want me to do?’ (OF; Graal, 132.36)

- These verbs are neither assertive or factive, but express the protagonist’s attitude towards a hypothetical, possibly future, state of affairs. In OF these verbs typically take the subjunctive mood.

- We have chosen to treat these volitives as a separate group, Class V.

NB: OE and OF percentages not comparable! (since the OE sample of non-V2 clauses is not exhaustive)
Remarks on the distribution

- For Old English, there exist some apparent counterexamples to our hypothesis: 20 V2 examples in classes C and D.
  - However, most of these are only apparent (as will be discussed later!).
  - The difference A/B/E/V vs. C/D is in any case statistically significant (Fisher’s exact test; p=0.0013).
    - Significant differences between classes (p<0.05) are A vs. D, A vs. E, A vs. V, B vs. E, D vs. E, E vs. V.
- For Old French, there are no V2 complements of verbs of classes C or D.
  - There are no examples at all of class C verbs, and relatively few of class D.
  - Still, the difference A/B/E/V vs. C/D is significant (p=0.0003).
    - All differences between classes are significant (p<0.05) except B vs. E and D vs. V.
Class A verbs – Old English

- OE: 43 different verbs, 444 clauses. 22 verbs followed by V2 structure.

<table>

*ondrædan* ‘to dread’

hie magon ondrædan ðæt him weorðen ða wyrttruman færcorfene
they may dread that them become the roots carved-out
‘They may dread that their roots might be carved out.’

(cocura,CP:45.339.19.2286)
cynn wesan ‘to be proper’

ðonne is cynn ðæt him spīwe ðæt wif on ðæt nebb
then is proper that him.DAT spit the woman in the face
‘Then it is proper that the woman spits in his face’

(cocura,CP:5.45.2.249)

- All but two of the 16 examples of apparent V2 that the search returns can be interpreted as having:
  - a quirky subject (6)
  - an extrapolosed heavy subject (6)
  - no subject at all, thus ‘accidental’ V2 (2)
- The two given above are the only potentially problematic examples.
Class D verbs – Old French

- 12 verbs, 44 clauses. No instances of V2.
Class E verbs – Old English

- 27 verbs, 267 clauses. 18 verbs followed by a V2 structure.

| tot | V2 | 267 | 111 | 41.6 % |
witan ‘to know’
Us is to witenne þæt on ðreo wisan bið geðylld æteowod
us is to know that on three wises is patience manifested
‘We should know that patience is manifested in three ways’
(cocathom2,+ACHom_II,_42:315.155.7126)

séon ‘see’
He geseah ða þæt hine ne mihte nan læce gehælan
he saw then that him.ACC NEG could no doctor heal
‘He saw then that no doctor could heal him’
(cocathom2,+ACHom_II,_37:279.213.6277)
Class E verbs – Old French

- 13 verbs, 235 clauses. 5 verbs followed by a V2 structure.

commander ‘command’

Et encor vos commant je que tant com vos seroiz en ceste queste ne mengiez de char ne ne bevez de vin

and again you commande I that all-that as you will-be in this quest NEG eat of meat and NEG drink of wine

‘And again I command you that as long as you take part in this quest, you should not eat any meat nor drink any wine.’
Summing up

- We find that embedded V2 is allowed after verbs of classes A, B and E.
- There are hardly any instances of embedded V2 after classes C and D.
- This asymmetry is expected if V2 is C-V2 and not I-V2.
Embedded V2 and the complementizer

- If V2 involves movement to the CP field, the complementizer cannot block this movement if verb movement does not target the same head as the complementizer.
- In the case of class A, B and E verbs we will therefore posit that these verbs select a higher complementizer, possibly one under Force°.
- Class C and D verbs select a lower complementizer, possibly under Fin°.
Evidence for a higher complementizer

- In Of the two complementizer positions may contain overt material

Or dit li contes *que* quant Melianz se fu partiz de Galaad *que* il now says the story that when Meliant REFL was gone from Galaad that he chevaucha tant que il vint a une forest ancienne rode all that he came to a forest ancient

‘The story tells that when Meliant had left Galahad, he rode until he came to a very old forest.’

- Analysis

Or dit li contes \([\text{ForceP que} \ [\text{TopP quant} \ldots \ [\text{Fin que} \ [\text{TP il chevaucha} \ldots]]]]\)
Evidence for a higher complementizer

- The same kind of example is found in OE:

  Hu ne wost ðu nu þaet ælc þara manna þe oðerne
  how NEG know you now that each the.GEN men.GEN that other-ACC

  swiðe lutad þaet hine lyst bet þaccian and cyssan
  dearly loves that him.ACC.SUBJ likes better touch.INF and kiss.INF

  ðonne oðerne on bær lic ... ?
  the.ACC other-ACC on bare body

  ‘Don’t you know that every man who loves another would prefer to touch
  and kiss the other’s naked body?’ (cosolilo, Solil_1:42.14.539)

- Analysis

  Hu ne wost ðu nu [ForceP þaet [TopP ælc ... [FinP þaet [TP hine lyst ...]]]]
Conclusion

- Old English and Old French V2 in complement clauses appears to be sensitive to the type of predicate it is embedded under.
- In Old English, embedded V2 in general is very rare.
  - There are few apparent examples of embedded V2 under class C and D predicates in the YCOE, and vanishingly few that stand up to scrutiny.
- In Old French, embedded V2 is not uncommon.
  - But there are no examples at all under class C and D predicates in our dataset.
- For OE and OF, a CP-V2 analysis fits the facts where an IP-V2 analysis fails.
  - For future work: check embedded topicalization and other kinds of embedded clauses!
